Product Description

The proposed volume provides both fundamental and detailed information about the computational and computational-experimental studies which improve our knowledge of how leaving matter functions, the different properties of drugs (including the calculation and the design of new ones), and the creation of completely new ways of treating numerical diseases. Whenever it is possible, the interplay between theory and experiment is provided. The book features computational techniques such as quantum-chemical and molecular dynamic approaches and quantitative structure-activity relationships. The initial chapters describe the state-of-the art research on the computational investigations in molecular biology, molecular pharmacy, and molecular medicine performed with the use of pure quantum-chemical techniques. The central part of the book illustrates the status of computational techniques that utilize hybrid, so called QM/MM approximations as well as the results of the QSAR studies which now are the most popular in predicting drugs' efficiency. The last chapters describe combined computational and experimental investigations.

 Springer

Product Description

This book would combine chapters written by the most qualified authors around the world whose research encompasses the effect of morphine or other opioids on tumor growth and metastasis. This includes clinicians involved in trials determining which type of post surgical pain management can minimize the risk of recurrence or metastasis, researchers working on animal models and studying the effect of morphine on tumors, and most importantly the mechanism for this effect, and lastly cell biologists. There is currently a lot of research going on trying to reconcile the pro- and anti-cancer aspects of opioids actions.

Product Description

This book examines statistical techniques that are critically important to Chemistry, Manufacturing, and Control (CMC) activities. Statistical methods are presented with a focus on applications unique to the CMC in the pharmaceutical industry. The target audience consists of statisticians and other scientists who are responsible for performing statistical analyses within a CMC environment. Basic statistical concepts are addressed in Chapter 2 followed by applications to specific topics related to development and manufacturing. The mathematical level assumes an elementary understanding of statistical methods. The ability to use Excel or statistical packages such as Minitab, JMP, SAS, or R will provide more value to the reader. The motivation for this book came from an American Association of Pharmaceutical Scientists (AAPS) short course on statistical methods applied to CMC applications presented by four of the authors. One of the course participants asked us for a good reference book, and the only book recommended was written over 20 years ago by Chow and Liu (1995). We agreed that a more recent book would serve a need in our industry. Since we began this project, an edited book has been published on the same topic by Zhang (2016). The chapters in Zhang discuss statistical methods for CMC as well as drug discovery and nonclinical development. We believe our book complements Zhang by providing more detailed statistical analyses and examples.

Product Description

Clinical Psychopharmacology offers a comprehensive guide to clinical practice that explores two major aspects of the field: the clinical research that exists to guide clinical practice of psychopharmacology, and the application of that knowledge with attention to the individualized aspects of clinical practice. The text consists of 50 chapters, organized into 6 sections, focusing on disease-modifying effects, non-DSM diagnostic concepts, and essential facts about the most common drugs. This innovative book advocates a scientific and humanistic approach to practice and examines not only the benefits, but also the harms of drugs. Providing a solid foundation of knowledge and a great deal of practical information, this book is a valuable resource for practicing psychiatrists, psychiatric nurse practitioners, medical students and trainees in psychiatry, as well as pharmacists.
